d-separation.

~~3 structure~~

~~A → B → C~~ know/unknow

a triple is ~~interactive~~ if ~~know~~ B then don't need know A to conclude C.

The are 3 structure of triple.

1. A → B → C

if don't know B → ~~not~~ active because have a path to make from A to C

if know B → blocked because don't need A to conclude C.

2. A ← B → C

if don't know B → active because we can deduce from A to B then conclude C

But if know B, the information of A is useless so that it blocked.

3. A → B ← C.

if know B, the relation ship between A and C are connected because to get B have to get A and C → active

But if do not know B, we can not deduce A and C because it independ → blocked

In Naive Bayes, assume that each feature are independent so that each class do not affect other in class.

In TAN, each feature have the special relation ship, so that it help model can learn ~~from~~ from complex data set. ~~that have some~~

Just write it
